

Is the Strait of Gibraltar suitable for energy extraction?

A non-hydrostatic hydrodynamic model of the Strait of Gibraltar with high spatial and temporal resolution has been used to assess suitable areas for energy extraction from marine currents. The model shows great spatial variability of the available energy flux, ranging from 200 W m^{-2} to more than 1800 W m^{-2} .

Can MIT-GCM be used in the Strait of Gibraltar?

The non-hydrostatic version of MIT-gcm has been implemented in a high resolution grid in the Strait of Gibraltar to estimate the energy fluxes associated with marine currents in the Strait of Gibraltar and to identify areas suitable for exploiting this renewable energy resource.

Why is the Strait of Gibraltar a good place to live?

The Strait of Gibraltar holds areas where ocean currents are strong, around a velocity of 2 m s^{-1} , compared with 3 m s^{-1} in the Strait of Messina or about 2 m s^{-1} in Ireland, which makes it suitable to install power marine farms.
