What is a microgrid & how does it work?

A microgrid is a group of interconnected loads and distributed energy resources that acts as a single controllable entity with respect to the grid. It can connect and disconnect from the grid to operate in grid-connected or island mode. Microgrids can improve customer reliability and resilience to grid disturbances.

How much does a microgrid cost?

Microgrids are complex systems that require specialized skills to operate and maintain. Microgrids include controls and communication systems that contain cybersecurity risks. A 2018 study conducted by the National Renewable Energy Laboratory found that microgrids in the Continental U.S. cost an average of \$2 million-\$5 million per megawatt.

How are microgrids transforming the energy industry?

Microgrids are revolutionizing the energy industry by combining renewable energy sources, battery storage and backup generator sets. Every microgrid is unique. Solar panels, wind turbines, battery banks, diesel gensets and CHP modules - whether operating separately or in parallel - can all be included in these sophisticated and flexible systems.

Should a microgrid be integrated with a utility grid?

To do this seamlessly, the microgrid should be integrated with the utility's automation systems at the substation and distribution levels. By connecting a microgrid to the utility grid as a DER, you can help increase the role of renewables on the grid and improve grid resilience.

Why should you invest in a microgrid?

Enterprises are more motivated than ever to control energy costs and increase sustainability, while the utility grids they rely on grow more vulnerable due to aging infrastructure, extreme weather, and rising energy demand. A microgrid can help your organization achieve its goals and control its energy future - with or without capital investment.

What is a microgrid control system?

Microgrid control systems: typically, microgrids are managed through a central controller that coordinates distributed energy resources, balances electrical loads, and is responsible for disconnection and reconnection of the microgrid to the main grid. Load: the amount of electricity consumed by customers.
