Well a sand battery is just one piece of the puzzle. It will store heat. What will you do with that stored heat? Heat up water for showers? You might not need the extra step. Just heat the water directly. A sand battery has a few advantages over water. It can store heat for a little bit longer, and at a bigger range of temperatures.

A "sand battery" is a type of high-temperature thermal energy storage system that uses sand or sand-like materials as the storage medium. The heat energy is stored in the sand, and can be recovered later by using the sand to heat a fluid or gas, which can then be used to generate electricity or for other purposes. Sand batteries are considered to be a type of thermal energy ...

For context, lead-acid batteries have an RTE of about 70%. 8 Lithium-Ion batteries for large energy storage, like those in many industrial-scale energy storage facilities and maybe even your home, have an RTE of around 90%. 9 But commercial and industrial thermal batteries are reportedly hitting RTE's of 90% or more. 10 11 12 13
