Battery capacity allows energy managers to store electricity and time its consumption to respond to high demand or peak load situations. Many microgrids integrate renewable energy, battery storage and on-site gen-sets to create more predictable and longer duration on-site power.

Specifically, the capacities of the battery and hydrogen storage are half of the load capacity. The storage durations of the battery and hydrogen are 2 h and 400 h, respectively. The installed capacity of renewables is 200 kW, comprising an equal share of solar and wind. The cost coefficients can be found in [5].
