How to control a microgrid?

Microgrid - overview of control The control strategies for microgrid depends on the mode of its operation. The aim of the control technique should be to stabilize the operation of microgrid. When designing a controller, operation mode of MG plays a vital role. Therefore, after modelling the key aspect of the microgrid is control.

How a microgrid can switch between modes?

However, switching between the modes is majorly executed according to the protection control of the microgrid. The two challenging scenarios concerned with the protection and mode switching of microgrid are: Synchronized reclosing of a microgrid with the utility (i.e. switching from autonomous to grid-connected mode).

Can microgrid control a smooth transition between grid-connected and islanding operation modes?

According to the characteristics of microgrid in both grid-connected and islanding operation modes, control strategies are proposed to achieve smooth transition between these two modes.

How does a csmtc control a microgrid?

Once the islanding instance is detected, the CSMTC signals the SSW to open and the controller registers the mode of operation as an 'islanded mode'. Simultaneously, the primary controller of the microgrid's master DG is signalled to switch from PQ control to Vf control (i.e. current control to voltage control) mode of operation.

How does E-STATCOM control a microgrid?

The switching transients are controlled by the E-STATCOM as it switches its mode of control operation. As a result, the microgrid achieves a smooth transition from grid-connected mode to an islanded mode of operation. The microgrid operating in islanded mode, demands a smart approach to synchronize and reconnect with the restored utility system.

What are microgrid modes of Operation?

Therefore, the microgrid modes of operation can be classified into grid connected, islanded, transition between grid-connected mode to the islanded mode and vice-versa. In any mode of operation, the heat generated by some of the micro-sources can be used to supply the heat demand of the local load.
