What is a latent heat thermal energy storage (lhtes) unit?

We present the experimental analysis and numerical modeling of a lab-scale shell and tube latent heat thermal energy storage (LHTES) unit with a (latent) storage capacity of about 10-15 kWh. The phase change material (PCM) is a high density polyethylene (HD-PE) with phase change temperatures between 120 and 135 °C.

What are the three types of thermal energy storage?

Thermal Energy Storage (TES) is constituted by three main categories: sensible,thermo-chemical,and latent heat storage[3]. Latent Heat Thermal Storage (LHTS) uses PCMs,which undergo melting or solidification when energy is exchanged with a heat transfer medium.

Can a latent heat thermal storage reactor be optimized for demand-side management?

This work investigates the optimized design of a latent heat thermal storage reactor, integrated in an existing building supplied by district heating, for demand-side management applications. The storage reactor was designed as a tube bundle heat exchanger in which a commercial-grade paraffin was used as the phase change material.

What is latent heat thermal storage?

By changing tubes pitch and fins, the use of phase change material was optimized. Latent heat thermal storage offers a flexible service to members of a heat district gridas the stored heat can be used to reduce the morning peak demand, limiting the consequences for the production facilities.

What is a 2D computational domain of a staggered tube bundle heat exchanger?

Fig. 5. 2D computational domain of a staggered tube bundle heat exchanger. The scope of this type of result visualization is to observe the behaviour of the PCM in the most critical region, that is, the outlet section where the fluid exits and completes the heat transportation.

How does a heat exchanger work?

A steel tube, 1800 mm long with 15 mm outer diameter, is used as heat exchanger between the heat transfer fluid (HTF) water and the PCM. It is installed coaxial to the storage shell. To allow the visual detection of the melting process, the shell is divided into an inner glass cylinder with 170 mm inner diameter and an outer acrylic glass cylinder.
