

Does Finland have green power?

Finland gets most of its gas from Russia, so the war in Ukraine has drawn the issue of green power into sharp focus. It has the longest Russian border in the EU and Moscow has now halted gas and electricity supplies in the wake of Finland's decision to join NATO.

What does the Finnish government want to do about bioenergy?

The most recent program outlining the Finnish government's visions and principles, published in June 2023, states that the government, through its national decisions and by influencing EU decision making, intends to maintain an environment for bioenergy that is steady and predictable.

How will Finland achieve emissions-free electricity?

The path to emissions-free electricity will primarily be laid by wind power. Onshore wind will make up a large part of Finland's growth in renewable electricity generation, and the country will also develop its first large-scale offshore farms, according to the IEA.

Can Finland replace fossil fuels in the energy sector?

There is a good possibility that Finland can replace fossil fuels fully in the energy sector; wind energy will increase its share of electricity production, and biomass will continue to play a crucial role in the heating sector. Industry and the transport sector, however, face greater challenges and should be studied in more detail.

How can Finland achieve climate neutrality by 2035?

Finland's key policies to achieve climate neutrality by 2035 include: Boosting the energy efficiency of current building stock and moving to zero-emission heating. The path to emissions-free electricity will primarily be laid by wind power.

What role does bioenergy play in Finland's climate and energy policies?

Bioenergy also plays a key role in Finland's climate and energy policies: forestry biomass is currently a key source of electricity and heat, and biofuels are set to play a central role in supporting the transport sector's clean energy transition.

Finland plans to achieve carbon neutrality by maintaining a high share of nuclear energy, increasing the role of renewables in power generation and heat production, improving energy efficiency, and electrifying sectors such ...

The developers say this could solve the problem of year-round supply, a major issue for green energy. Using low-grade sand, the device is charged up with heat made from cheap electricity from...

Finland gets 29% of all its energy needs from advanced biofuels. It also has extensive nuclear and hydro networks. But some of its bold targets for continued fuel-use improvement call for sustained government ...

These are some of the findings from the International Energy Agency (IEA), a body set up in the wake of the oil crisis of the 1970s. It has 30 member countries and seven associates, and promotes energy security, ...

The facility, scheduled to be completed in 2024, will become the first industrial-scale green hydrogen production plant in Finland. This 20-megawatt P2X facility will turn renewable energy into hydrogen fuel.

These are some of the findings from the International Energy Agency (IEA), a body set up in the wake of the oil crisis of the 1970s. It has 30 member countries and seven associates, and promotes energy security, economic development and environmental protection. Alternative energy production is one of the IEA's key focus areas.

Finland aims to become carbon neutral by 2035, putting it fourth in the world and ahead of every other country in Europe. Nuclear is already a key part of its energy mix, but it is working hard to scale up wind and solar capacity.

In 2023, Plug announced a 1GW project to produce green hydrogen in Kristinestad, Finland. This project, using Plug's electrolyzer products combined with Finland's carbon dioxide-free energy, is focused on ...
